Solution: Suppose that A , B , and C are sets. First we show that $A \setminus (B \cap C) = (A \setminus B) \cup (A \setminus C)$. Proof. We show this as a series of logical equivalences: $x \in A \setminus (B \cap C)$
 $\iff x \in A \wedge x \notin B \cap C, x \in A \wedge (x \notin B \vee x \notin C), (x \in A \wedge x \notin B) \vee (x \in A \wedge x \notin C), x \in A \setminus B \vee x \in A \setminus C, x \in (A \setminus B) \cup (A \setminus C)$;
which of course shows the desired result. Next we show that $A \cap (B \cup C) = (A \cap B) \cup (A \cap C)$. Proof. We show this in the same way:

Homological quantities provide robust computable invariants of dynamical systems well-adapted to numerical methods. As a consequence, several groups have actively implemented algebraic topological invariants to characterize the qualitative behavior of dynamical systems. Examples include tracking patterns of nodal domains, proving the existence of invariant sets in

Algebraic varieties are the central objects of study in algebraic geometry, a sub-field of mathematics. Classically, an algebraic variety is defined as the set of solutions of a system of polynomial equations over the real or complex numbers. Modern definitions generalize this concept in several different ways, while attempting to preserve the geometric intuition behind the original definition.

Topology - Discussion Homework 2

September 8, 2016 1-6 How many faces

does an n -simplex have? Solution: Let n

be an n -simplex. Since n has n

$+1$ vertices, there are $n+1$ 0-faces of

n . Likewise, n has $n+1$ 1-faces. In

general, we can say that the number of (k

1)-faces is $n+1-k$. So, we have $\sum_{k=0}^{n-1} (n+1-k)$

total faces of n . 1-8 Triangulation
