Embryology And The Recapitulation Theory

Recapitulation refers to summarizing, repeating, or restating something. Thus, "ontogeny recapitulates phylogeny" is the claim that the developing embryo goes through stages that resemble, at least structurally, the various animals on that organism's ancestral trip up the tree of life.

Recapitulation Theory: How Embryology Does Not Prove ...

The theory of recapitulation, also called the biogenetic law or embryological parallelism—often expressed using Ernst Haeckel's phrase "ontogeny recapitulates phylogeny"—is a historical hypothesis that the development of the embryo of an animal, from fertilization to gestation or hatching , goes through stages resembling or representing successive adult stages in the evolution of the animal's remote ancestors .

Ernst Haeckel - Wikipedia

Von Baer's laws of embryology provided a framework to research the relationships and patterns
between the development of different classes of organisms, and the patterns between ontogeny
and the diversification of species on Earth (phylogeny). Von Baer's laws, published in 1828,
responded to Johann Friedrich Meckel 's recapitulation theory.

The biogenetic law is a theory of development and evolution proposed by Ernst Haeckel in Germany
in the 1860s. It is one of several recapitulation theories, which posit that the stages of development
for an animal embryo are the same as other animals' adult stages or forms. Commonly stated as
ontogeny recapitulates phylogeny, the biogenetic law theorizes that the stages an animal embryo
undergoes during development are a chronological replay of that species' past evolutionary forms.
