Microbicides are experimental products containing drugs that prevent vaginal and/or rectal transmission of HIV and/or sexually transmitted infections. Researchers are studying microbicides delivered in the form of vaginal rings, gels, films, inserts and enemas. A safe, effective, desirable, and affordable microbicide against HIV could help to prevent many new infections.

Currently, no markers exist for the biological activity of microbicides and no markers have been established as correlates of protection for microbicides. One analysis has suggested a 1000 ng/ml drug concentration of tenofovir as a potential correlate of protection [ 66 ] , but this needs to be prospectively assessed.

## **Overview of Microbicides for the prevention of human ...**

In part two, 'Microbicide Data' is an eagerly anticipated actual inventory of the Handbook Microbicides for the Protection of Materials which appeared in 1993. The combination of the two parts in one book is special and has resulted in the most authoritative information in the field.

Microbicides. What they are. Microbicides are compounds that can be applied inside the vagina or rectum to protect against sexually transmitted infections (STIs) including HIV. They can be formulated as gels, creams, films, or suppositories. Microbicides may or may not have spermicidal activity (contraceptive effect).

## **WHO | Microbicides**

Sexual abstinence is not a realistic option for women who want to bear children, or who are at risk of sexual violence. In such situations, the use of microbicides could offer both primary protection (in the absence of condoms) and secondary protection (if a condom breaks or slips off during intercourse).
